PART A — USER STORY DOCUMENT

Section 1 — Project Overview & Problem Statement

1.1 Background

Everest Hydro Pneumatic Solutions (everesthps.com) is an industrial air compressor and material handling equipment manufacturer and supplier based in Chakan, Pune, Maharashtra. The company was established in 2020 and has a professionally built React/TypeScript/Vite website powered by Supabase as its backend database.

1.2 Current State — Critical Issues

An SEO audit conducted in April 2026 revealed that the website has **zero pages indexed** in Google Search. The site:everesthps.com operator returns no results, meaning no organic search traffic is being received. The overall SEO health score is **28/100** — classified as Critical.

Metric	Current Value	Target	Gap
Google Index Status	0 pages indexed	All 50+ pages indexed	Critical
SEO Health Score	28 / 100	>70 / 100	-42 pts
Organic Traffic	0 visits/month	500+ visits/month	100% gap
Schema Markup	Incomplete	Product + LocalBiz + FAQ	Missing
Meta Tags	Static (1 tag for all)	Unique per page	13 pages missing
Sitemap.xml	Not present	Full dynamic sitemap	Missing
robots.txt	Not present	Configured	Missing

1.3 Root Cause Analysis

The primary root cause is that the website is a **Single Page Application (SPA)** built with React + Vite. When Googlebot requests the page, it receives only `<div id="root"></div>` in the HTML. JavaScript must execute to render content. Without Server-Side Rendering (SSR) or pre-rendering, Googlebot cannot see any content, products, or text, making the site effectively invisible to search engines. Additionally, no sitemap.xml, robots.txt, or Google Search Console configuration exists, so Google has never been told this site exists.

1.4 Business Impact

■
BUSINESS
IMPACT

Zero Google indexing means zero organic traffic. In B2B industrial sales (air compressors, Pune), buyers frequently search for 'screw compressor supplier Pune', '3HP oil-free compressor price India', 'air compressor for dental clinic'. Everest HPS is currently invisible for all these searches. Competitors with indexed sites are capturing all potential leads. Fixing SEO is the single highest-ROI action available to this business right now.

Section 2 — Stakeholders & Roles

Role	Name	Responsibilities	Review Authority
Product Owner	Everest HPS Management	Business requirements, priorities, acceptance	Final sign-off
Senior Architect	[To Be Assigned]	Technical architecture review, code patterns, security	Architecture sign-off
Business Analyst	[To Be Assigned]	Requirements validation, acceptance criteria verification	BA sign-off
Frontend Developer	[To Be Assigned]	React component changes, meta tags, schema, prerendering	Implementation
DevOps Engineer	[To Be Assigned]	robots.txt, sitemap deployment, GSC setup, CI/CD	Deployment
QA Engineer	[To Be Assigned]	Schema validation, meta tag testing, Lighthouse audit	Test sign-off

Section 3 — User Stories (US-001 to US-014)

■ **FORMAT** Each User Story follows the format: Story ID | Title | Statement | Business Value | Acceptance Criteria | Expected Behavior | Technical Implementation Steps | Test Cases | Definition of Done. All stories must pass QA before being marked Complete.

US-001

● **CRITICAL**

Priority: P0 — Urgent

Effort: 2 hours

US-001: Create robots.txt and sitemap.xml

User Story Statement:

■ **STORY** As a Search Engine Crawler (Googlebot), I need a robots.txt file at the domain root and a sitemap.xml listing all indexable pages, so that I can correctly crawl, understand, and index all public content on everesthps.com and present it in Google search results.

Business Value:

Without robots.txt, Googlebot wastes crawl budget on /admin/* pages and has no guidance. Without sitemap.xml, Google must discover pages by following links — which fails completely for a JavaScript SPA where pages are not in server-rendered HTML. This is the prerequisite for ALL other SEO improvements. Nothing else works until crawlers can find the site.

Acceptance Criteria & Expected Behaviors:

AC-01	A robots.txt file exists at https://everesthps.com/robots.txt and returns HTTP 200	Browser/curl request to /robots.txt returns 200 with valid robots syntax
AC-02	robots.txt allows all public pages (User-agent: *; Allow: /)	Googlebots can access /, /products, /about, /services, /gallery, /contact, /products/*
AC-03	robots.txt disallows /admin/ to prevent crawl waste	User-agent: * Disallow: /admin/ is present and Googlebot skips admin paths
AC-04	robots.txt references the sitemap URL	Last line: Sitemap: https://everesthps.com/sitemap.xml
AC-05	sitemap.xml exists at https://everesthps.com/sitemap.xml and returns HTTP 200 with Content-Type: application/xml	Browser shows valid XML; sitemap validator tool reports 0 errors
AC-06	sitemap.xml includes all static pages: /, /about, /products, /services, /gallery, /contact, /privacy, /terms	8 static entries found with , , tags
AC-07	sitemap.xml includes every product page slug from the database (dynamic generation)	Product slugs like /products/3hp-screw-compressor are listed. Count matches DB product count
AC-08	Each URL entry has set to today's date and value (homepage=1.0, products=0.8, others=0.6)	XML contains 2026-04-06 equivalent and valid priority 0.0–1.0

AC-09	Sitemap is submitted in Google Search Console under Index > Sitemaps	GSC shows sitemap status: Success, with page count > 0
-------	--	--

Technical Implementation Steps:

1	Create /public/robots.txt	Create file at /public/robots.txt (Vite auto-serves /public as static). Content: User-agent: * Allow: / Disallow: /admin/ blank line Sitemap: https://everesthps.com/sitemap.xml
2	Create static sitemap for known routes	Create /public/sitemap.xml with containing all 8 static routes. Use , monthly/weekly,
3	Build dynamic sitemap API	Create /api/sitemap.xml endpoint (or Vite plugin) that queries Supabase products table, fetches all slugs, and generates entries for each. Run at build time.
4	Add vite-plugin-sitemap OR script	In vite.config.ts add plugin that runs post-build to generate sitemap from route list + Supabase slug query. Output to dist/sitemap.xml
5	Verify robots.txt locally	Run npm run dev, navigate to localhost:5173/robots.txt, confirm content is correct
6	Verify sitemap locally	Navigate to localhost:5173/sitemap.xml, confirm XML is valid, paste into https://www.xml-sitemaps.com/validate-xml-sitemap.html
7	Deploy to production	Deploy updated build to hosting. Verify https://everesthps.com/robots.txt and /sitemap.xml both return 200
8	Submit to Google Search Console	In GSC: Index > Sitemaps > Add a new sitemap > enter sitemap.xml > Submit. Wait 48 hours and check status.
9	Verify in GSC	After 48 hrs check GSC Coverage report. Pages should begin appearing under Valid or Discovered counts.

Test Cases:

TC#			
TC-01	GET https://everesthps.com/robots.txt	HTTP 200, text/plain, contains 'Sitemap:'	[]
TC-02	GET https://everesthps.com/sitemap.xml	HTTP 200, application/xml, valid urlset XML	[]
TC-03	Paste sitemap.xml in Google Rich Results Test	0 errors, all URLs listed	[]
TC-04	Check /admin/dashboard in robots.txt	Disallow: /admin/ is present	[]
TC-05	Submit sitemap in Google Search Console	Status: Success, no errors	[]

■ DONE CRITERIA

Definition of Done: robots.txt and sitemap.xml deployed to production, returning HTTP 200, GSC shows 'Success' for sitemap, at least 1 page visible in Coverage report within 7 days. Code reviewed by Senior Architect. No regression on existing pages.

US-002

● CRITICAL

Priority: P0 — Urgent

Effort: 4 hours

US-002: Dynamic Meta Tags per Page (react-helmet-async)

■ **STORY** As an SEO specialist / Google Search, I need every page on the site to have a unique <title> tag and <meta name='description'> that accurately describes that specific page's content, so that Google can display meaningful search result snippets and users can identify relevant results before clicking.

Current Problem:

index.html contains one static title: 'Everest Hydro Pneumatic Solutions - Hydraulic & Pneumatic Industrial Products'. This same title appears in Google for EVERY page — /about, /products, /products/3hp-screw-compressor, /contact. Google's algorithm downgrades sites with duplicate titles, and users cannot distinguish pages in search results.

Acceptance Criteria & Expected Behaviors:

AC-01	react-helmet-async is installed as a dependency	package.json shows react-helmet-async. HelmetProvider wraps the entire app in App.tsx
AC-02	Home page title: 'Air Compressor Supplier Pune Everest Hydro Pneumatic Solutions'	View source / React DevTools / SEO extension shows this exact title on /
AC-03	Products listing page title: 'Industrial Air Compressors & Pneumatic Equipment Everest HPS'	Title changes when navigating to /products
AC-04	Product detail page title: '{product.name} Buy in Pune Everest HPS'	Each individual product page has a unique title using the actual product name from DB
AC-05	About page title: 'About Us — Everest Hydro Pneumatic Solutions, Est. 2020, Chakan Pune'	Title is unique and contains relevant location keyword
AC-06	Contact page title: 'Contact Everest HPS Air Compressor Supplier +91-8855820105'	Title includes phone number for local SEO benefit
AC-07	Meta description for each page is 150-160 characters, unique, and keyword-rich	Checking with SEO tool shows description length 150-160 chars and no duplicates across pages
AC-08	Product meta description uses product.name and product.description from the database	For product slug 'screw-compressor', description includes the word 'screw compressor'

Technical Implementation Steps:

1	Install react-helmet-async	Run: npm install react-helmet-async. Add to dependencies in package.json.
2	Wrap App in HelmetProvider	In src/App.tsx: import { HelmetProvider } from 'react-helmet-async'. Wrap entire return with ...
3	Create SEO utility component	Create src/components/SEO.tsx with props: title, description, canonical, ogImage. Renders with all tags.
4	Add SEO to Home.tsx	Import SEO component. Add

5	Add SEO to Products.tsx	Add
6	Add dynamic SEO to ProductDetail.tsx	After product loads from Supabase:
7	Add SEO to About, Services, Gallery, Contact pages	Each page gets unique, keyword-optimised title and description. Contact page includes phone number in title.
8	Test with browser devtools	Open each page, right-click > View Page Source (after hydration) or use React DevTools to verify and are correct.
9	Validate with Google Rich Results Test	Paste each URL into https://search.google.com/test/rich-results and verify title/description shown.

Code Reference — SEO Component:

```
// src/components/SEO.tsx

import { Helmet } from 'react-helmet-async';

interface SEOProps {
  title: string;
  description: string;
  canonical?: string;
  ogImage?: string;
  ogType?: string;
}

export function SEO({
  title, description,
  canonical, ogImage, ogType = 'website'
}: SEOProps) {
  const baseUrl = 'https://everesthps.com';
  const fullCanonical = canonical
    ? `${baseUrl}${canonical}`
    : baseUrl;

  return (
    <Helmet>
      <title>{title}</title>
      [meta name="description" content={description} />
      [link rel="canonical" href={fullCanonical} />
      [meta property="og:title" content={title} />
      [meta property="og:description" content={description} />
      [meta property="og:type" content={ogType} />
      [meta property="og:url" content={fullCanonical} />
    </Helmet>
  );
}
```

```
{ogImage && (  
  [meta property="og:image" content={ogImage} />  
  )}  
</Helmet>  
);  
}
```

■ **DONE
CRITERIA**

Definition of Done: All 13 public pages/route-types have unique title and description tags. Google Rich Results Test shows correct tags for each page. No two pages share the same title. Senior Architect has reviewed the SEO component pattern.

US-003

● CRITICAL

Priority: P0 — Urgent

Effort: 1 hour

US-003: Fix Canonical Tag — Point to Each Page's Own URL

■ **STORY** As Google Search, I need each page to declare its canonical URL as its own URL, so that I can identify each page as unique content and not flag all pages as duplicates of the homepage <https://everesthps.com>.

Current Bug: index.html sets `<link rel="canonical" href="https://everesthps.com">` as a static tag for every page. This tells Google that /products, /about, and every product slug is a 'copy' of the homepage. Google may de-index or ignore all non-homepage content as duplicate.

Acceptance Criteria & Expected Behaviors:

AC-01	Homepage (/) canonical is https://everesthps.com/	Viewing source on / shows [link rel='canonical' href='https://everesthps.com/']
AC-02	Products page (/products) canonical is https://everesthps.com/products	Navigating to /products shows canonical pointing to /products, not homepage
AC-03	Product detail canonical matches the product slug URL	/products/3hp-screw-compressor has canonical https://everesthps.com/products/3hp-screw-compressor
AC-04	Static pages (about, services, etc.) each have their own canonical	Each of the 8 static pages has a unique canonical matching their own URL path
AC-05	Canonical is implemented via react-helmet-async SEO component	No hardcoded canonical in index.html (it must be removed from index.html)

Technical Implementation Steps:

1	Remove canonical from index.html	Delete the static [link rel='canonical' href='https://everesthps.com'] from index.html. This will be handled dynamically.
2	Update SEO component	The SEO component from US-002 already handles canonical via the canonical prop. Ensure canonical prop is passed correctly in every page.
3	Pass correct canonical to each page	Home: , Products: , ProductDetail:
4	Test with curl or devtools	For each page, inspect in React DevTools or use curl to verify correct canonical URL is rendered.
5	Validate with Google Search Console URL Inspection	Use GSC > URL Inspection > enter each page URL > check 'Google-selected canonical'. Should match the page URL.

■ **DONE CRITERIA** Definition of Done: All pages have unique canonical URLs matching their own path. index.html no longer contains a hardcoded canonical tag. GSC URL Inspection confirms canonical is correct for at least 3 tested pages.

US-004

● CRITICAL

Priority: P0 — Urgent

Effort: 3 hours

US-004: Product JSON-LD Structured Data in ProductDetail.tsx

■ STORY As Google Search, I need Product structured data (JSON-LD) on each product detail page, so that I can display rich result snippets (price, availability, image) in search results for queries like '3HP screw compressor price Pune'.

AC-01	JSON-LD script with @type: Product is present in of each product detail page	Google Rich Results Test shows Product entity detected with 0 errors
AC-02	Schema includes: name, description, image, sku (from product.slug), brand, offers	All required fields present. Rich Results Test shows no missing required fields
AC-03	Offers block includes: price (from product.price_range), priceCurrency: 'INR', availability	If price_range has value, offer.price is set. If 'Price on Request', use offeredBy instead
AC-04	Schema includes manufacturer (Everest Hydro Pneumatic Solutions) and areaServed: IN	Google can identify the product as sold by Everest HPS, eligible for local rich results
AC-05	JSON-LD is injected via react-helmet-async script tag	Script tag appears in page , not body. Type is application/ld+json

Technical Implementation Steps:

1	Create buildProductSchema function	In src/lib/schema.ts create function buildProductSchema(product, categoryName). Returns a JSON object conforming to schema.org/Product.
2	Add JSON-LD to ProductDetail.tsx	In ProductDetail.tsx, after product loads: const schema = buildProductSchema(product, categoryName). Add inside SEO component: [script type='application/ld+json'>{JSON.stringify(schema)}]
3	Handle price_range parsing	Use formatPrice() from lib/format.ts. If result is 'Price on Request' set priceSpecification as PriceSpecification with minPrice: null. Otherwise parse the price range for low/high.
4	Handle specifications	Include additionalProperty array from product.specifications array. Each spec becomes a PropertyValue with name and value.
5	Test with Rich Results Test	Submit product URL to https://search.google.com/test/rich-results. Confirm Product type detected, no errors, all required fields green.
6	Test with Schema Markup Validator	Also test at https://validator.schema.org/. Confirm no critical errors.

Code Reference — Schema Builder:

```
// src/lib/schema.ts
export function buildProductSchema(product: Product, categoryName?: string) {
  const baseUrl = 'https://everesthps.com';
  const price = formatPrice(product.price_range);
```

```
const isPOR = price === 'Price on Request';

const specs = Array.isArray(product.specifications)

? product.specifications.map(([name, value]: [string, string]) => ({
  '@type': 'PropertyValue',
  name, value
}))
: [];

return {
  '@context': 'https://schema.org',
  '@type': 'Product',
  name: product.name,
  description: product.description,
  image: product.image_url
  ? [product.image_url] : [],
  sku: product.slug,
  category: categoryName || 'Industrial Equipment',
  brand: {
    '@type': 'Brand',
    name: 'Everest Hydro Pneumatic Solutions'
  },
  manufacturer: {
    '@type': 'Organization',
    name: 'Everest Hydro Pneumatic Solutions',
    url: baseUrl,
    address: {
      '@type': 'PostalAddress',
      addressLocality: 'Chakan, Pune',
      addressRegion: 'Maharashtra',
      postalCode: '410501',
      addressCountry: 'IN'
    }
  },
  additionalProperty: specs,
  offers: isPOR ? undefined : {
    '@type': 'Offer',
    url: `${baseUrl}/products/${product.slug}`,
    priceCurrency: 'INR',
```

```
price: price.replace(/^[0-9]/g, '').slice(0, 8),
availability: 'https://schema.org/InStock',
seller: {
  '@type': 'Organization',
  name: 'Everest HPS'
}
};
}
```

■ **DONE**
CRITERIA

Definition of Done: Every product detail page passes Google Rich Results Test with Product type and 0 errors. Schema includes name, description, image, sku, brand, and offers where price is available.

US-005

● CRITICAL

Priority: P0 — Urgent

Effort: 30 min

US-005: Fix LocalBusiness Schema with Real Business Data

■ **STORY** As Google Knowledge Graph, I need accurate LocalBusiness structured data with real contact information so that I can display the correct business card in local search results, Google Maps integration, and knowledge panels.

Current Problem: index.html LocalBusiness schema contains placeholder values:

```
// WRONG — Current index.html (PLACEHOLDER DATA)

"telephone": "+91-9876543210", // ← FAKE NUMBER

"email": "info@everesthydro.com", // ← WRONG EMAIL

"address": {

  "streetAddress": "123 Industrial Park", // ← FAKE ADDRESS

  "addressLocality": "Mumbai" // ← WRONG CITY

}
```

AC-01	telephone is +91-8855820105 (real number from site settings)	Schema validator shows telephone: +918855820105
AC-02	email is everesthps@gmail.com	Schema shows correct email address
AC-03	streetAddress is 'Kalp Residency, 109 B Wing, Chakan Shikrapur Road'	Address matches real business registration
AC-04	addressLocality is 'Chakan' and addressRegion is 'Maharashtra'	Location correctly identifies Chakan, Pune — not Mumbai
AC-05	postalCode is 410501	Correct PIN code for Chakan, Pune
AC-06	openingHoursSpecification added for Mon–Sat 09:00–18:30	Rich Results Test shows opening hours
AC-07	GST number included in schema as identifier	taxID: '27ATEPT3692E1ZD' present in schema

Technical Implementation Steps:

1	Open index.html	Locate the [script type='application/ld+json']> block in index.html
2	Replace all placeholder values	Update telephone, email, streetAddress, addressLocality, addressRegion, postalCode with real data from the About page code and Supabase site_settings.
3	Add openingHoursSpecification	Add array with dayOfWeek: ['Monday','Tuesday','Wednesday','Thursday','Friday','Saturday'], opens: '09:00', closes: '18:30'

4	Add priceRange and paymentAccepted	priceRange: '■■■', paymentAccepted: 'Cash, Bank Transfer, UPI'
5	Add areaServed	areaServed: ['Pune', 'Maharashtra', 'India']
6	Add sameAs links	sameAs: ['https://www.indiamart.com/everesthydro-pneumatic-solution']
7	Validate with Schema Validator	Paste updated JSON into https://validator.schema.org/ and confirm 0 errors

■ DONE
CRITERIA

Definition of Done: LocalBusiness schema in index.html contains 100% real, accurate business data. Schema.org validator reports 0 errors. openingHoursSpecification is present.

US-006

● CRITICAL

Priority: P0 — Urgent

Effort: 1 hour

US-006: Set Up Google Search Console

■ STORY As a website administrator, I need Google Search Console (GSC) to be set up, verified, and monitored, so that I can track indexing status, submit sitemaps, identify crawl errors, monitor search performance, and receive alerts from Google about site issues.

AC-0 1	Google Search Console account is created at https://search.google.com/search-console	Admin can log in to GSC and see the property everesthps.com
AC-0 2	Domain property or URL-prefix property verified for https://everesthps.com	GSC shows green 'Ownership verified' status for the property
AC-0 3	Sitemap submitted: https://everesthps.com/sitemap.xml	GSC > Index > Sitemaps shows sitemap with Status: Success
AC-0 4	URL Inspection tool tested for at least 3 pages (/ , /products , one product slug)	Each URL can be inspected; no 'Blocked by robots.txt' or 'Crawled - currently not indexed' errors
AC-0 5	Coverage report monitored — target: 0 errors within 2 weeks	Coverage tab shows increasing Valid pages count week over week
AC-0 6	Core Web Vitals report reviewed	CWV report accessed. Any 'Poor' URLs identified and added to sprint backlog

Technical Implementation Steps (Non-Code):

1	Create GSC Property	Go to search.google.com/search-console > Add property > Enter https://everesthps.com > Choose 'URL prefix' method
2	Verify via HTML tag method	GSC will provide a meta tag: <code>[meta name='google-site-verification' content='xxxxx']</code> . Add this to <code>index.html</code> (or via <code>react-helmet</code> in <code>App.tsx</code> globally).
3	Alternative: DNS verification	Add a TXT record to the domain DNS with the value Google provides. This is more permanent and works for all subdomains.
4	Submit sitemap	In GSC: Index > Sitemaps > Enter 'sitemap.xml' (relative) > Submit. Wait 24-48 hours.
5	Check Coverage	Index > Coverage > review Valid, Excluded, Warning, Error counts. Investigate any errors.
6	Set up email alerts	GSC Settings > Preferences > enable email notifications for coverage issues, manual actions, security issues.
7	Add team members	GSC Settings > Users and permissions > add developer and BA email with 'Full' permission.
8	Check Google Analytics integration	Link GSC to Google Analytics 4 property for complete traffic picture.

■ DONE CRITERIA Definition of Done: GSC property verified for <https://everesthps.com>. Sitemap submitted with Status: Success. Coverage report shows at least 1 Valid URL within 1 week of submission.

US-007

● CRITICAL

Priority: P0 — Urgent

Effort: 1-2 days

US-007: SPA Pre-Rendering for Googlebot (Critical Architecture Fix)

■ STORY As Googlebot, I need to receive server-rendered or pre-rendered HTML containing actual content when I request any page on everesthps.com, so that I can read and index the text, headings, product names, and metadata without needing to execute JavaScript.

Architecture Decision — Three Options:

Option	Approach	Pros	Cons	Recommended
A: vite-plugin-ssr (SSR)	Full server-side rendering. Node.js server renders React on each request.	Best SEO, real-time data	Major refactor, needs Node server	Future state
B: vite-plugin-prerender (Static)	Pre-generates HTML snapshots at build time for all known routes.	Easy to add, no server needed, good for static pages	Dynamic product pages need sitemap to be pre-enumerated	★ RECOMMENDED NOW
C: Prerender.io (Service)	Cloud service that intercepts bot requests and serves cached HTML versions.	Zero code change, works immediately	Monthly cost ~\$15–45/mo	Quickest fix

AC-01	When Googlebot requests /, it receives HTML containing Air Compressor Supplier Pune	curl -A Googlebot https://everesthps.com/ returns HTML with product content, not empty div
AC-02	When Googlebot requests /products/3hp-screw-compressor, HTML contains product name and specs	HTML response contains product name and at least one spec value
AC-03	LCP (Largest Contentful Paint) is under 2.5 seconds for all key pages	Google PageSpeed Insights reports LCP < 2.5s for desktop and mobile
AC-04	Pre-rendered pages are served for known bot user-agent strings	Different HTML returned for Googlebot vs regular Chrome browser

Implementation Steps (Option B — vite-plugin-prerender):

1	Install plugin	npm install --save-dev vite-plugin-prerender
2	Configure in vite.config.ts	Import PrerenderSPAPlugin. In plugins array: PrerenderSPAPlugin({ staticDir: path.join(__dirname, 'dist'), routes: ['/ ', '/about', '/products', '/services', '/gallery', '/contact', '/privacy', '/terms'] })
3	Fetch product slugs at build time	Create a pre-build script that queries Supabase products table, gets all slugs, writes to a routes.json file. Add product routes like '/products/' + slug to PrerenderSPAPlugin routes array.
4	Test locally	Run npm run build. In dist/ folder, verify /about/index.html exists and contains actual content (not empty div). Open dist/about/index.html in browser/editor.

5	Configure hosting	Ensure hosting serves the pre-rendered index.html for each path. If using Vercel/Netlify, add vercel.json or netlify.toml with rewrites to serve pre-rendered files to bots.
6	Verify with Googlebot simulator	Use GSC URL Inspection > Test Live URL for key pages. Confirm rendered HTML shows actual content.

■ DONE
CRITERIA

Definition of Done: curl with Googlebot user-agent returns HTML containing actual page content for /, /products, and at least one product slug. GSC URL Inspection shows 'Page is eligible to appear in Google Search'. LCP < 2.5s on PageSpeed Insights.

US-008

● HIGH

Priority: P1 — High

Effort: 2 hours

US-008: BreadcrumbList Schema on Product Pages

■ STORY As Google Search, I need BreadcrumbList structured data on product pages so that I can display breadcrumb navigation trails (Home > Products > Product Name) in search result snippets, improving click-through rates.

Acceptance Criteria & Expected Behaviors:

AC-01	BreadcrumbList JSON-LD is present on /products/:slug pages	Rich Results Test detects BreadcrumbList type
AC-02	Breadcrumb has 3 levels: Home (/) > Products (/products) > {product.name} (/products/{slug})	JSON has 3 ListItem entries with correct position, name, item values
AC-03	Google shows breadcrumb in SERP snippet (within 2-4 weeks of indexing)	Manual SERP check shows breadcrumb under result title

Technical Implementation Steps:

1	Create buildBreadcrumbSchema function	In src/lib/schema.ts: accepts product name and slug, returns BreadcrumbList JSON-LD with 3 items
2	Add to ProductDetail.tsx Helmet	Inject alongside product schema: [script type='application/ld+json'>{JSON.stringify(breadcrumbSchema)}]
3	Test with Rich Results Test	Submit product URL, confirm BreadcrumbList detected, 0 errors

■ DONE CRITERIA Definition of Done: All acceptance criteria pass QA review. Code reviewed by Senior Architect. US-008 closes.

US-009

● HIGH

Priority: P1 — High

Effort: 2 hours

US-009: Dynamic Open Graph Tags per Page

■ STORY As a social media user sharing a product link, I need the shared preview to show the actual product name, description, and product image — not a generic company image and description.

Acceptance Criteria & Expected Behaviors:

AC-01	og:title matches page title for all pages	Facebook Sharing Debugger shows correct og:title
AC-02	og:description is the page's unique meta description	No two pages share the same og:description
AC-03	og:image for product pages is product.image_url from the database	WhatsApp/Facebook preview shows product photo, not Pexels stock photo
AC-04	og:image for homepage is a high-quality company/product photo	Homepage share shows relevant company image
AC-05	og:url is the page's canonical URL	og:url matches the page's actual URL

Technical Implementation Steps:

1	Update SEO component	Add ogImage and ogUrl props. Update ProductDetail.tsx to pass product.image_url as ogImage.
2	Pass og:image to all pages	Each page passes an appropriate ogImage to the SEO component
3	Test with Facebook Sharing Debugger	https://developers.facebook.com/tools/debug/ — paste URL, verify all tags
4	Test WhatsApp preview	Share product URL in WhatsApp. Confirm product image and name appear in preview

■ DONE CRITERIA Definition of Done: All acceptance criteria pass QA review. Code reviewed by Senior Architect. US-009 closes.

US-010

● HIGH

Priority: P1 — High

Effort: 30 min

US-010: Fix All Image Alt Text

■ STORY

As Google Image Search and screen reader users, I need all images to have descriptive, keyword-rich alt attributes so that product images appear in image search and the site is accessible.

Acceptance Criteria & Expected Behaviors:

AC-01	All product images in ProductCard.tsx have alt='{product.name}'	Source shows alt text with product name
AC-02	Gallery thumbnail nav images in ProductDetail.tsx have alt='{product.name} - view {i+1}'	No empty alt="" on clickable gallery images
AC-03	Category card images in Home.tsx have alt='{category.name} — Everest HPS'	Category images have descriptive alt text
AC-04	Zero images with empty or missing alt attributes on all public pages	axe DevTools accessibility audit: 0 image alt text failures

Technical Implementation Steps:

1	Audit all img tags	Search codebase for alt="" and alt={undefined} or missing alt props
2	Fix ProductDetail.tsx gallery thumbs	Change alt="" to alt={` \${product.name} - image \${i+1} `}
3	Fix category images in Home.tsx	Set alt={` \${cat.name} — Everest HPS products `}
4	Run accessibility audit	Install axe DevTools browser extension, audit each page, confirm 0 image alt errors

■ DONE CRITERIA

Definition of Done: All acceptance criteria pass QA review. Code reviewed by Senior Architect. US-010 closes.

US-011

● HIGH

Priority: P1 — High

Effort: 30 min

US-011: Lazy-Load Lightning Script to /contact Only

■ STORY As a website visitor on any non-contact page, I do not want the browser to download the Salesforce Lightning Out JavaScript library (external script from Salesforce domain) because it creates unnecessary network load and delays page rendering on pages where it is not used.

Acceptance Criteria & Expected Behaviors:

AC-01	LightningService.init() is NOT called in App.tsx global useEffect	Network tab on /about page shows NO request to fwseries3-dev-ed.develop.my.site.com
AC-02	LightningService.init() is called ONLY in Contact.tsx when the component mounts	Network tab on /contact page shows the Lightning script loading
AC-03	All other pages (Home, Products, About, Services, Gallery) load without Lightning JS	Lighthouse performance score improves by removing unused JS from non-contact pages

Technical Implementation Steps:

1	Remove from App.tsx	Delete the useEffect that calls LightningService.init().catch() from App.tsx
2	Move to Contact.tsx	In Contact.tsx useEffect: call LightningService.init().catch(...) — already done in Contact.tsx useEffect, just remove from App.tsx
3	Verify network tab	Open DevTools Network > visit /about — confirm no salesforce domain requests
4	Verify /contact still works	Visit /contact — confirm Lightning form still loads

■ DONE CRITERIA Definition of Done: All acceptance criteria pass QA review. Code reviewed by Senior Architect. US-011 closes.

US-012

● HIGH

Priority: P1 — High

Effort: 2 hours

US-012: FAQ Schema on Product Category and Service Pages

■ STORY As Google Search, I need FAQPage structured data on product/service pages so that I can display FAQ accordion rich results below search listings, significantly expanding the click area in SERPs.

Acceptance Criteria & Expected Behaviors:

AC-01	FAQPage JSON-LD present on /services page with at least 4 Q&A; pairs	Rich Results Test detects FAQPage on /services with 0 errors
AC-02	FAQPage JSON-LD present on /products page with at least 3 Q&A; pairs	FAQPage detected on /products
AC-03	Questions are genuine buyer questions with keyword-rich answers	Q: 'What HP range do you offer?' A: 'We offer 3HP to 75HP... Pune... pan-India'

Technical Implementation Steps:

1	Create FAQ data constants	In src/data/faqs.ts define FAQ arrays for services and products pages
2	Create FAQSchema component	Takes faqs array, renders JSON-LD FAQPage schema via react-helmet-async
3	Add to Services.tsx and Products.tsx	Import FAQSchema, pass relevant questions array
4	Validate with Rich Results Test	Test /services and /products URLs

■ DONE CRITERIA Definition of Done: All acceptance criteria pass QA review. Code reviewed by Senior Architect. US-012 closes.

US-013

● MEDIUM

Priority: P2 — Medium

Effort: 1 week

US-013: Blog / Resources Section for Long-Tail Keywords

■ STORY As an industrial buyer searching for product information, I want to find helpful articles from Everest HPS when I search queries like 'best screw compressor for manufacturing Pune' or 'oil free compressor for dental clinic price India', so that I discover Everest HPS organically and can make an informed purchase decision.

Acceptance Criteria:

AC-01	A /blog route exists and is listed in the navigation	Clicking Blog in nav goes to /blog, not 404
AC-02	At least 5 articles exist on launch: topics include air compressor buying guide, screw vs reciprocating, dental clinic compressor, 5HP compressor price, material handling equipment	5 blog posts visible on /blog listing page
AC-03	Each article has unique title, meta description, canonical URL, and Article JSON-LD schema	Rich Results Test detects Article type on each blog post
AC-04	Article URLs follow pattern /blog/{slug}	Slugs are descriptive: /blog/air-compressor-buying-guide-pune

Implementation Steps:

1	Add blog table to Supabase	Create 'blog_posts' table with: id, title, slug, excerpt, content (HTML), author, published_at, image_url, is_published
2	Create Blog.tsx and BlogPost.tsx page components	Blog.tsx lists posts. BlogPost.tsx shows full article with Article JSON-LD schema.
3	Add /blog and /blog/:slug routes in App.tsx	Register new routes, add to navigation and sitemap
4	Add admin interface for blog posts	Add 'Blog' tab in AdminDashboard.tsx with a simple WYSIWYG editor for creating posts
5	Write first 5 articles	Content should be 600-1200 words each, keyword-optimised, with product links to relevant catalogue pages
6	Add to sitemap.xml generation	Include /blog and all blog post slugs in sitemap

■ DONE CRITERIA Definition of Done: All acceptance criteria verified. US-013 closed by Product Owner.

US-014

● MEDIUM

Priority: P2 — Medium

Effort: 2 hours setup

US-014: Google Business Profile Setup for Local SEO

■ STORY As a local industrial buyer in Pune searching 'air compressor supplier near me' or 'screw compressor Chakan Pune', I want to see Everest HPS in the Google Maps pack (top 3 local results) so that I can call or get directions immediately.

Acceptance Criteria:

AC-01	Google Business Profile created/claimed at business.google.com	Admin can manage GBP listing
AC-02	Profile is 100% complete: name, category, address, phone, website, hours, photos	GBP completeness meter shows 100%
AC-03	At least 5 product photos uploaded to GBP	Photos visible in Google Maps listing
AC-04	At least 3 Google Reviews from real customers obtained	Star rating visible in local search results
AC-05	Website URL in GBP points to https://everesthps.com	GBP profile links to correct website

Implementation Steps:

1	Create Google Business Profile	Go to business.google.com > Manage now > Enter business name 'Everest Hydro Pneumatic Solutions'
2	Verify business address	Google will send a postcard to Chakan Pune address with a verification code. Enter code within 14 days.
3	Complete profile	Add business category (Industrial Equipment Supplier), description, photos, products, services
4	Add products/services	Use GBP Products feature to list key compressor models with photos and price ranges
5	Request reviews from existing clients	Send WhatsApp message to existing clients with direct Google review link
6	Link to GSC	In GSC, link the GBP property for additional local insights

■ DONE CRITERIA Definition of Done: All acceptance criteria verified. US-014 closed by Product Owner.

Section 4 — Senior Architect Review & Sign-off

4.1 Architecture Concerns & Recommendations

■ SPA vs SSR

The current Vite/React CSR architecture is the root cause of zero indexing. The recommended short-term fix is vite-plugin-prerender (static snapshots). Long-term, evaluate migration to Remix (React Router v7) which provides SSR out of the box with minimal refactoring cost given the existing React Router v6 code.

■ react-helmet-async thread safety

react-helmet-async is the correct choice over react-helmet. The async version is server-render safe and handles concurrent mode. Ensure HelmetProvider is placed at the very root level, above BrowserRouter, to prevent context issues.

■ Schema injection pattern

All JSON-LD should be built in src/lib/schema.ts as pure functions (no React dependency). This makes testing trivial (jest unit tests for schema output) and keeps components clean. Senior Architect should enforce this separation in code review.

■ Supabase slug generation

The sitemap generation script must fetch all product slugs from Supabase at BUILD time. This means VITE_SUPABASE_URL and VITE_SUPABASE_ANON_KEY must be available in the CI/CD build environment (Vercel env vars). Architect must confirm this is safe — anon key is public-facing, so this is acceptable.

■ robots.txt admin protection

Disallowing /admin/ in robots.txt is necessary but note that security by obscurity is not security. Ensure the Supabase RLS policies are the actual security layer, not robots.txt.

■ Blog content architecture

If blog is added (US-013), consider whether Supabase is the right CMS for blog content or whether a headless CMS (Contentful, Sanity) provides better editorial workflow. For initial 5 articles, Supabase is sufficient.

4.2 Priority Override Recommendation from Senior Architect:

■ ARCH
NOTE

Recommended Sprint Order: Sprint 1 (Week 1): US-005 (30 min), US-001 (2h), US-006 (1h), US-003 (1h), US-002 (4h). Sprint 2 (Week 2): US-007 (2 days — most impactful but hardest), US-004 (3h), US-011 (30 min). Sprint 3 (Week 3): US-008, US-009, US-010, US-012. Sprint 4+: US-013, US-014. Rationale: Technical SEO (indexing) must be fixed before on-page SEO or content work — there is no point optimizing pages that cannot be crawled.

4.3 Senior Architect Sign-off

Senior Architect	Signature: _____	Date: _____	Name: _____
Architecture Review Comments: 			

Status: ☐ Approved ☐ Approved with Comments ☐ Rejected — Revisions Required

Section 5 — Business Analyst Review & Sign-off

5.1 Business Value Validation

Story ID	Business Justification	ROI Estimate	BA Approved
US-001	Without sitemap + robots.txt, zero Google indexing. Every other SEO effort is worthless without this.	Prerequisite — all organic traffic depends on this	☐ Yes ☐ No
US-002	Unique titles directly improve CTR. Studies show title optimization increases CTR by 20-30%. For 500 monthly impressions this = 100-150 additional clicks.	High — CTR improvement	☐ Yes ☐ No
US-004	Product rich results can increase CTR by 30-35% for commercial intent queries. Direct revenue impact.	High — direct leads	☐ Yes ☐ No
US-006	GSC is free. Without it you cannot measure any SEO success. Required for all future SEO decisions.	Free — essential monitoring	☐ Yes ☐ No
US-007	Core fix: without pre-rendering, none of the on-page SEO changes can be seen by Google. Highest technical priority.	Critical — enables all other stories	☐ Yes ☐ No
US-013	Blog creates long-tail traffic. Industry data shows product companies with 10+ blog posts get 3x more organic traffic than those without.	Medium-High — 3-6 month payoff	☐ Yes ☐ No
US-014	Google Business Profile drives local leads. B2B industrial buyers in Pune area frequently use Google Maps to find local suppliers.	High — local lead generation	☐ Yes ☐ No

5.2 Business Analyst Sign-off

Business Analyst	Signature: _____	Date: _____	Name: _____
Product Owner	Signature: _____	Date: _____	Name: _____

Status: ☐ All Stories Approved ☐ Conditional Approval ☐ Stories Require Revision

■ BA
NOTES

BA Notes: All 14 user stories have been reviewed for business alignment. Critical stories US-001 through US-007 are pre-approved for immediate sprint inclusion. US-013 and US-014 require resource availability assessment before sprint commitment. Sprint velocity should be calculated based on developer availability.

PART B — CLAUDE-SEO GITHUB REPO GUIDE

Section 6 — Introduction to the claude-seo Tool

6.1 What Is claude-seo?

claude-seo (github.com/AgriciDaniel/claude-seo) is an open-source, universal SEO skill designed specifically for **Claude Code CLI** — Anthropic's terminal-based AI coding tool. It is a collection of 19 sub-skills and 12 subagents that give Claude Code deep SEO capabilities, including full site audits, technical SEO analysis, schema validation, content quality (E-E-A-T), sitemap generation, GEO/AEO optimization for AI search, backlink analysis, and local SEO.

■ IMPORTANT IMPORTANT: claude-seo runs inside the Claude Code CLI (a terminal application), NOT in the claude.ai chat interface. You must install Claude Code on your local machine first. See: <https://claude.ai/download> (Claude Code desktop app) or install via npm.

6.2 What claude-seo Can Do for everesthps.com

Capability	Command	What It Analyses
Full site audit	<code>/seo audit https://everesthps.com</code>	All 9 SEO categories in parallel. Produces health score 0-100 with prioritised action plan
Single page audit	<code>/seo page https://everesthps.com/products/3hp-screw-compressor</code>	Deep analysis of one page: title, description, headings, speed, images, links
Technical SEO	<code>/seo technical https://everesthps.com</code>	Crawlability, indexability, Core Web Vitals (LCP/INP/CLS), canonicals, hreflang
Schema audit	<code>/seo schema https://everesthps.com</code>	Detect, validate, and generate structured data for all pages
Content quality	<code>/seo content https://everesthps.com/about</code>	E-E-A-T analysis, thin content detection, keyword density, readability
Sitemap generate	<code>/seo sitemap generate</code>	Creates a complete sitemap.xml for the project
GEO/AEO	<code>/seo geo https://everesthps.com</code>	Optimise for AI Overviews, ChatGPT, Perplexity. GEO = Generative Engine Optimization
Image SEO	<code>/seo images https://everesthps.com</code>	Alt text, file sizes, WebP conversion, lazy loading analysis
Local SEO	<code>/seo local https://everesthps.com</code>	NAP consistency, Google Business Profile, local schema, citation analysis
SEO plan	<code>/seo plan https://everesthps.com</code>	Strategic 90-day SEO roadmap with prioritised tasks and estimated traffic impact

Section 7 — Prerequisites & System Requirements

Requirement	Minimum Version	How to Verify	Install Link
Claude Code CLI	Latest	claude --version	claude.ai/download or npm i -g @anthropic-ai/claude-code
Node.js	v18.0.0+	node --version	nodejs.org
Python	3.9+	python3 --version	python.org
pip	23.0+	pip --version	Included with Python
Git	2.0+	git --version	git-scm.com
Anthropic API Key	Active key	echo \$ANTHROPIC_API_KEY	console.anthropic.com
Internet access	Required	ping everesthps.com	N/A — needed for URL fetch

Section 8 — Step-by-Step Installation Guide

Step 1: Install Claude Code CLI

```
# Option A: Install via npm (recommended)

npm install -g @anthropic-ai/claude-code

# Option B: Download desktop app

# Visit: https://claude.ai/download and download Claude Code

# Verify installation:

claude --version

# Expected output: claude-code/x.x.x
```

Step 2: Set your Anthropic API Key

```
# On macOS / Linux:

export ANTHROPIC_API_KEY=sk-ant-your-key-here

# Add to ~/.bashrc or ~/.zshrc for permanent setup:

echo 'export ANTHROPIC_API_KEY=sk-ant-your-key-here' >> ~/.bashrc

source ~/.bashrc

# On Windows (Command Prompt):

set ANTHROPIC_API_KEY=sk-ant-your-key-here

# Get your API key from: https://console.anthropic.com
```

Step 3: Clone and Install claude-seo

```
# Method A: One-line install (Unix/macOS/Linux)

curl -fsSL https://raw.githubusercontent.com/AgriciDaniel/claude-seo/main/install.sh > install.sh

cat install.sh # REVIEW the script first (good security practice)

bash install.sh # Run when satisfied

rm install.sh # Clean up

# Method B: Git clone (allows script inspection first)

git clone --depth 1 https://github.com/AgriciDaniel/claude-seo.git

cat claude-seo/install.sh # Review before running

bash claude-seo/install.sh

# Method C: Claude Code Plugin Marketplace (if available)

claude /plugin marketplace add AgriciDaniel/claude-seo

claude /plugin install claude-seo@AgriciDaniel-claude-seo

# Method D: Windows

git clone --depth 1 https://github.com/AgriciDaniel/claude-seo.git
```

```
powershell -ExecutionPolicy Bypass -File claude-seo/install.ps1
```

Step 4: Install Python Dependencies

```
# The install script creates a venv. If it fails, install manually:

# Option A: Use the venv created by installer

~/.claude/skills/seo/.venv/bin/pip install -r ~/.claude/skills/seo/requirements.txt

# Option B: User-level install

pip install --user -r ~/.claude/skills/seo/requirements.txt

# Optional: Install Playwright for visual analysis

pip install playwright

playwright install chromium
```

Step 5: Verify Installation

```
# Start Claude Code

claude

# Test the SEO skill is loaded

/seo

# Expected output: SEO skill help message with list of commands

# If you see "command not found" – restart claude and try again

# Run a quick test on any page

/seo page https://example.com
```

■ FILE LOCATIONS

The installer places skills in `~/.claude/skills/seo/` and subagents in `~/.claude/agents/`. These are loaded automatically when Claude Code starts.

Section 9 — Complete Command Reference for everesthps.com

All commands below should be run inside Claude Code CLI after typing `claude` in your terminal. All commands start with `/seo`.

Full Site Audit (Run this first!)

<code>/seo audit https://everesthps.com</code>	Runs all 9 analysis modules in parallel. Produces a comprehensive health score (0-100) with categorised issues. This is your starting point — run this and read the full report before doing anything else.
<code>/seo plan https://everesthps.com</code>	Generates a strategic 90-day SEO roadmap specifically for your site, including estimated traffic impact for each recommendation.

Technical SEO

<code>/seo technical https://everesthps.com</code>	Audits 9 technical categories: crawlability, indexability, Core Web Vitals (LCP/INP/CLS), mobile usability, HTTPS, canonicals, redirects, pagination, international.
<code>/seo technical https://everesthps.com/products/3hp-screw-compressor</code>	Technical audit on a specific product page — checks load speed, canonical, meta robots.

Schema & Structured Data

<code>/seo schema https://everesthps.com</code>	Detects all existing schema, validates against schema.org spec, identifies missing schema types that would benefit the site.
<code>/seo schema https://everesthps.com/products/3hp-screw-compressor</code>	Validates and suggests improvements for Product schema on a specific product page.
<code>/seo schema generate https://everesthps.com/services</code>	Auto-generates the correct JSON-LD schema code for the services page that you can copy into your code.

Content & E-E-A-T Analysis

<code>/seo content https://everesthps.com/about</code>	Evaluates E-E-A-T (Experience, Expertise, Authoritativeness, Trustworthiness) per Google's 2025 Quality Rater Guidelines. Identifies thin content.
<code>/seo content https://everesthps.com/products/screw-compressor</code>	Content analysis for a product page. Keyword usage, word count, readability score, missing content gaps.

Sitemap Generation

<code>/seo sitemap https://everesthps.com</code>	Analyses your existing sitemap (or lack thereof) and gives detailed recommendations.
<code>/seo sitemap generate</code>	Generates a complete, valid sitemap.xml file for your project based on all known routes. Saves to project directory.

Page-Level Deep Audit

/seo page https://everesthps.com	Deep single-page analysis: title, meta description, heading hierarchy (H1-H6), image alt text, internal links, external links, word count, Core Web Vitals.
/seo page https://everesthps.com/products/3hp-screw-compressor	Full page audit on a specific product. Shows exactly what Google sees for this URL.

GEO / AI Search Optimization

/seo geo https://everesthps.com	Analyses optimisation for AI Overviews in Google, ChatGPT web search, Perplexity, and other AI-powered search engines. Identifies AEO (Answer Engine Optimization) opportunities.
---------------------------------	---

Local SEO

/seo local https://everesthps.com	NAP (Name/Address/Phone) consistency check, Google Business Profile analysis, local schema validation, local keyword opportunities for Pune/Maharashtra.
-----------------------------------	--

Images

/seo images https://everesthps.com/products	Audits all product images: missing alt text, oversized files (>100KB), non-WebP formats, lazy loading implementation.
--	---

Section 10 — Complete SEO Audit Workflow for everesthps.com

Follow this exact workflow to get the maximum benefit from claude-seo. Complete each phase in order. Don't skip Phase 1.

Phase 1 — Initial Audit (Day 1, ~2 hours)

Run once. Build your baseline.

1	Open terminal in your project directory	cd /path/to/everesthps-website
2	Start Claude Code	claude
3	Run full site audit	/seo audit https://everesthps.com
4	Wait for all subagents to complete (~5-10 mins)	Claude will run technical, content, schema, performance, visual, GEO, local agents in parallel
5	Read the full report	Note the health score. Review Critical issues first, then High, then Medium
6	Save the report	Ask Claude: 'Save this report as a PDF' or copy to a document
7	Run the strategic plan	/seo plan https://everesthps.com
8	Save the 90-day plan	This becomes your SEO sprint backlog

Phase 2 — Technical Deep-Dive (Day 1-2)

Fix crawlability issues first.

1	Technical audit	/seo technical https://everesthps.com
2	Review Core Web Vitals	Note LCP, INP, CLS scores for desktop and mobile
3	Run sitemap analysis	/seo sitemap https://everesthps.com
4	Generate sitemap	/seo sitemap generate — copy output to /public/sitemap.xml
5	Schema audit	/seo schema https://everesthps.com
6	Generate LocalBusiness schema	/seo schema generate https://everesthps.com — copy JSON-LD to index.html
7	Review all suggested fixes	Prioritise by effort vs impact

Phase 3 — Page-by-Page Optimization (Week 1-2)

Optimize each key page.

1	Audit homepage	/seo page https://everesthps.com
2	Audit products listing	/seo page https://everesthps.com/products
3	Audit each product page (loop)	/seo page https://everesthps.com/products/{slug} for top 10 products
4	Audit services page	/seo page https://everesthps.com/services

5	Audit about page	/seo page https://everesthps.com/about
6	For each page: implement recommended title, description, schema fixes	Use the code changes from this User Story document
7	Run local SEO audit	/seo local https://everesthps.com

Phase 4 — Content & AI Search (Week 2-3)

Optimise for AI-era search.

1	E-E-A-T audit on key pages	/seo content https://everesthps.com/about and /services
2	GEO audit for AI Overviews	/seo geo https://everesthps.com
3	Images audit	/seo images https://everesthps.com/products
4	Implement content improvements	Improve About page with more Experience/Expertise signals
5	Product page content audit	/seo content https://everesthps.com/products/3hp-screw-compressor
6	Fix all identified content issues	Add missing content, fix thin pages

Phase 5 — Re-audit & Verify (Week 4)

Measure improvement.

1	Run full audit again	/seo audit https://everesthps.com
2	Compare new health score to baseline	Target: score increase of at least 20 points
3	Check GSC Coverage	Verify page indexing has improved
4	Check Rich Results Test for all schema	Confirm all JSON-LD passes
5	Run Lighthouse on key pages	Target LCP < 2.5s, CLS < 0.1, INP < 200ms
6	Document remaining gaps	Create next sprint backlog

Section 11 — Continuous SEO Monitoring Schedule

Frequency	Activity	Command / Tool	Time Required
Daily	Check GSC for coverage errors or manual actions	Google Search Console dashboard	5 min
Weekly	Full site re-audit with claude-seo	/seo audit https://everesthps.com	30 min
Weekly	Monitor GSC Performance report — clicks, impressions, CTR	GSC > Performance > Last 7 days	15 min
Weekly	Check Core Web Vitals in GSC	GSC > Experience > Core Web Vitals	10 min
Bi-weekly	Run /seo page on top 5 product pages	/seo page https://everesthps.com/products/{slug}	45 min
Monthly	Content freshness audit — update product descriptions	/seo content https://everesthps.com/products	2 hours
Monthly	Local SEO check — GBP reviews, NAP consistency	/seo local https://everesthps.com	30 min
Monthly	GEO audit for AI search visibility	/seo geo https://everesthps.com	30 min
Quarterly	Full schema regeneration for all product pages	/seo schema https://everesthps.com	2 hours
Quarterly	Competitor analysis and keyword gap review	/seo plan https://everesthps.com (re-run)	1 hour
Quarterly	Update sitemap with new products	/seo sitemap generate	30 min
When adding products	Audit new product page before publishing	/seo page + /seo schema on new product URL	20 min/page

Section 12 — Interpreting Reports & Taking Action

12.1 Understanding the Health Score

Score Range	Classification	Meaning	Action Required
0 – 30	CRITICAL	Major technical or indexing failures. Site may be invisible to Google.	Stop everything. Fix P0 issues immediately.
31 – 50	POOR	Multiple high-impact issues. Organic traffic severely limited.	Fix Critical then High issues within 2 weeks.
51 – 70	FAIR	Foundational SEO present but significant gaps in on-page/schema.	Systematic improvement sprint. 30-day plan.
71 – 85	GOOD	Solid SEO. Focus on content, backlinks, and UX improvements.	Ongoing optimization. Monthly audits.
86 – 100	EXCELLENT	Best-practice SEO. Competitive advantage in search.	Maintain and monitor. Competitor analysis focus.

12.2 Target Milestones for everesthps.com

Timeline	Target Score	Key Milestones
Week 1	28 → 45	robots.txt + sitemap deployed, GSC verified, meta tags dynamic per page
Week 2	45 → 60	Pre-rendering live, Product schema on all products, LocalBusiness schema fixed
Week 3-4	60 → 72	BreadcrumbList, FAQ schema, OG tags, image alt text, Lightning script lazy-load
Month 2	72 → 80	Blog section with 5 articles, GBP active with 3+ reviews, 10+ pages indexed
Month 3	80 → 85	30+ pages indexed, first organic leads via phone/contact form, 200+ monthly impressions

Appendix A — Master Definition of Done Checklist

Complete this checklist before closing any sprint. All items must be checked.

TECHNICAL FOUNDATIONS

- ☐ robots.txt exists at /robots.txt with correct Disallow and Sitemap entries
- ☐ sitemap.xml exists at /sitemap.xml with all public pages and all product slugs
- ☐ Sitemap submitted to Google Search Console with Status: Success
- ☐ GSC property verified for https://everesthps.com
- ☐ No pages return HTTP 404 that are in the sitemap
- ☐ HTTPS returns 200 for all sitemap URLs

META TAGS & CANONICAL

- ☐ Every page has a unique tag (no two pages share the same title)
- ☐ Every page has a unique [meta name='description'> (150-160 chars)
- ☐ Every page has [link rel='canonical'] pointing to its own URL
- ☐ react-helmet-async HelmetProvider wraps the entire application
- ☐ SEO component is used consistently across all page components
- ☐ index.html no longer contains hardcoded canonical or title

STRUCTURED DATA

- ☐ LocalBusiness schema contains real phone, email, address (Chakan, Pune 410501)
- ☐ Product schema present on all product detail pages — passes Rich Results Test
- ☐ BreadcrumbList schema present on product pages
- ☐ FAQPage schema present on /services and /products pages
- ☐ All schema passes schema.org validator with 0 errors
- ☐ All schema passes Google Rich Results Test with 0 errors

OPEN GRAPH & SOCIAL

- ☐ og:title matches page title on all pages
- ☐ og:description matches meta description on all pages
- ☐ og:image is product.image_url on product pages
- ☐ og:url matches canonical URL on all pages

Appendix B — Quick Reference: Claude-SEO Commands

Paste this as a cheat sheet. Run all commands inside the Claude Code CLI (c laude in terminal).

Command	Purpose	Use When
/seo audit https://everesthps.com	Full 9-category site audit with health score	Weekly check-in, after major changes
/seo plan https://everesthps.com	90-day strategic SEO roadmap	Sprint planning, quarterly reviews
/seo technical https://everesthps.com	Technical SEO: Core Web Vitals, crawl, index	After deploying code changes
/seo page https://everesthps.com/{path}	Deep single page analysis	When adding/updating any page
/seo schema https://everesthps.com	Detect and validate all structured data	After adding/modifying schema code
/seo schema generate https://everesthps.com/{page}	Auto-generate JSON-LD code for a page	Before implementing schema for a page
/seo content https://everesthps.com/{page}	E-E-A-T and content quality audit	Monthly content reviews
/seo sitemap generate	Create sitemap.xml file	After adding new products or pages
/seo geo https://everesthps.com	AI search optimization (Google AIO, ChatGPT)	Monthly, as AI search evolves
/seo local https://everesthps.com	Local SEO: GBP, NAP, local schema	Monthly, after GBP changes
/seo images https://everesthps.com/products	Image alt text, file sizes, WebP	When new product images added

■ Final Note — Start Here

■ START HERE

The single most important action right now: In your terminal, run 'curl -fsSL https://raw.githubusercontent.com/AgriciDaniel/claude-seo/main/install.sh > install.sh && bash install.sh' then run 'claude' and type '/seo audit https://everesthps.com'. The report will show you exactly the current state and what to fix first. Then implement US-001 through US-007 in order — these 7 critical stories will move your SEO score from 28 to ~60+ and get pages indexed in Google. All the code you need is in this document.
